

Why and When to Change the Compressor

Causes of Compressor Failures

- Lack or excess of refrigerant oils
- Internal corrosion
- Lack of servicing (regular changing of receiver drier)
- Circuit blocked – receiver drier clogged and/or expansion valve blocked
- Incorrect or no flushing of system when fitting new compressor
- Electrical problem in the clutch

Effects of Faulty Compressors

- A/C system does not operate at all
- Potentially result in damage to other A/C components
